Site adjustment in a semi-synthetic sequential causal evaluation

Confirmatory (primary set)

No prior action history (W = 0), later actions (P > 0): with site, **|bias| lower**
P1b-SITE mean D 2.198

One step, no later actions (K = 1, P = 0): with site, **|bias| slightly higher**
P2-SITE mean D 0.052

Linear site erasure
(prespecified linear-probe criterion)
Fitting set (278): met
Analysis windows (158): not met
Representation families not tested

EXPLORATORY: X1 (no verdict)
Eraser refitted on the analysis windows
MLP probe still decodes site
|bias| vs protocol eraser: small change
vs site retained: larger (P1b-FM cells)

At the prespecified α = 0.5, γ = 1 slice, 30 prior action steps largely attenuated the site difference (descriptive)
